

ORDRO → a multi-business POS platform: the plan

This is our map for turning ORDRO from a single-shop app into a platform that many separate businesses can sign up for and run their own shop inside — your own mini-Shopify. We build it in small, working stages so you always know the next step and always have something that runs.

Keep your current Streamlit site (ordroapp.com) running as-is. It's now your working prototype and reference — we build the new platform alongside it and only switch over when the new one is genuinely better.

1. What we're building

A web app where:

- Any business can **register their own account**.
- Each business logs in and sees **only their own** products, sales, customers, staff, and reports — completely separate from every other business.
- It's fast and app-like (no page reloads on every click).
- Later, the **same system** powers a mobile app (with offline) — because web and mobile share one backend.
- Later still, you can **charge businesses** a subscription.

The industry term for this is a **multi-tenant SaaS** (each business is a “tenant”). Square, Shopify, and Lightspeed are all built this way.

2. The recommended tools (and why)

Chosen to be powerful enough for a real product, but as achievable as possible for someone building with guidance:

- **Supabase** — your database + login system + data security, all in one.
 - Stores all data in PostgreSQL (a serious, scalable database).
 - Handles business **sign-up and login** out of the box.
 - Has a built-in feature called **Row-Level Security (RLS)** that makes each business automatically see only its own rows of data. This is the single hardest and most dangerous part of multi-tenancy — and Supabase gives it to us almost for free. This is the main reason we choose it.
 - Stores uploaded images, and has a free tier to start.
 - **Next.js (React)** — the website your users see and click. Fast, modern, no Streamlit lag. Deploys free on **Vercel**.
 - **Flutter (later)** — the mobile app, talking to the *same* Supabase. This is how we get your offline mobile goal without building everything twice.
 - **Stripe (later)** — to charge businesses a subscription, when you're ready.
-

3. How the pieces fit together

Every table (products, sales, customers, etc.) gets a hidden `business_id`. Row-Level Security guarantees a logged-in business can never read or change another business's rows — even if someone tried.

4. The roadmap (small stages, each one works)

Phase 0 — Foundations (setup). Create free accounts (Supabase, Vercel, GitHub), install the development tools on your PC, and get a blank “hello world” web app running locally. Goal: prove the pipeline works end to end.

Phase 1 — The MVP (smallest real version). *This is our first big goal.* - A business can **sign up and log in**. - Inside, they can add/edit **products** (name, price, stock). - A simple **Sell screen**: pick products, see a total, complete a sale. - Each business sees only their own products and sales. That's a usable, multi-business POS. Everything else builds on this.

Phase 2 — Core POS features. Customers, suppliers, expenses, better checkout, receipts, roles/staff per business, settings & branding per business.

Phase 3 — Reports & polish. Sales reports, low-stock alerts, dashboards, mobile-friendly layout.

Phase 4 — Make it a business. Subscription billing (Stripe), a public landing/marketing page, sign-up plans, admin tools for you to manage all businesses.

Phase 5 — Mobile + offline. The Flutter app on the same backend, with offline selling that syncs when back online.

We do **Phase 1 (the MVP) first** and get it truly working before moving on.

5. Honest costs

- **While building:** essentially **free** — Supabase, Vercel, and GitHub all have free tiers big enough to build and test on.

- **When live with real businesses:** expect roughly **Supabase Pro (~\$25/mo)** and possibly **Vercel Pro (~\$20/mo)** as you grow past the free limits, plus your domain. Stripe takes a small % of any subscriptions you charge.
 - These are normal, modest SaaS running costs and only kick in once you have paying businesses.
-

6. Honest about the commitment

- This is a **months-long project**, built in stages. That's normal for this kind of product.
 - Because other businesses will trust you with their **real sales data**, you're taking on real responsibility: keeping it secure, private, backed up, and reliable, and following payment/tax rules once money is involved.
 - It's very doable with guidance, and you can stop at any stable phase. Many founders also bring in a developer partner at some point — keep that open.
 - Your current live app keeps serving you the whole time; nothing is lost.
-

7. Immediate next steps (Phase 0)

1. Create a free **Supabase** account (supabase.com).
2. Create a free **Vercel** account (vercel.com), signed in with GitHub.
3. Install the development tools on your PC (Node.js, and a code editor — VS Code). I'll guide each install click by click.
4. Spin up a blank Next.js app and see it run in your browser.

Once that pipeline works, we start **Phase 1: business sign-up + products + a sell screen**.

When you're ready, say "let's start Phase 0" and I'll walk you through the very first account, one click at a time — exactly like we did with the website.
